

The Royal College of
Emergency Medicine

RCEM Winter Flow Project

Analysis of the data so far: 13th January 2017

Introduction

In 2015 we launched the 'Winter Flow Project' in an effort to highlight the difficulties facing an NHS struggling with unprecedented financial difficulties and insufficient resources.

The project looked at patient flow within Emergency Departments over the winter. It was a great success because of the generosity of its contributors, with over 50 NHS Trusts and Health Boards from across the UK submitting data over a six month period. This data helped to provide a better understanding system pressures and four hour standard performance.

This enabled the RCEM to broaden the debate around emergency medicine beyond the usual narrow focus on the four hour standard, and meant that providers, commissioners, the national press, and Governments in each of the nations of the UK were better informed about the challenges faced by staff working on the NHS frontline.

Given the success of the project, the College decided to repeat 'Winter Flow' for 2016/17. As was the case in 2015, each participating Trust/Board has submitted weekly data on attendances, four hour standard performance, delayed transfers of care and cancelled elective operations. These data together better reflect pressures, constraints and consequences for system performance.

The data is aggregated to ensure the focus of consideration is the wider health care system rather than the performance of individual Trusts/Boards. Over 50 Trusts/Boards encompassing more than 60 separate sites have submitted this data on a weekly basis since the beginning of October.

Published on a Friday of the week following data collection, the summary data provide a current overview of 'winter pressures'. The College is grateful to the participants who represent Trusts/Boards of all sizes and geographical locations.

Unlike NHS England datasets there is no suggestion that our project represents a complete or permanent scrutiny of the healthcare system. Our data includes all four countries of the UK though the majority of participating sites lie within England. It is a sample of such Trusts/Boards, albeit a large and representative sample.

The data has already been of immense value to the College and allows informed comment and analysis rather than speculation.

The weekly data and trend data are presented in the following tables.

Graph of acute beds in service

Active Bed Management

This shows that after an expected drop over the week of Christmas Trusts/Boards are working hard to flex their acute bed stock to meet increasing patient demand. In the second week of January the number of beds within the project group increased to 42,743 up from 42,148 the previous week. In total, there has been a 4.34% increase in the aggregate bed stock from the project starting point.

The extent to which the participating Trusts/Boards are adjusting their bed stock to meet demand is shown in the table below.

	No flexing	0 – 5%	5 – 10%	10 – 15%	15 – 20%
Number of sites	8	16	20	7	8

Graph of four hour performance by week since October

4 Hour Standard Performance - Simple Average Basis

In the second week of January four hour standard performance stood at 74.14%, down from 77.60% the previous week. The underlying picture shows 13 increases and 44 decreases across the project group. It should be noted the four hour standard performance in the 60% range are now commonplace.

Graph of Delayed Transfers of Care (DTOCs) by week since October

Delayed Transfer of Care Instances

The Delayed Transfers of Care data collected so far shows that after some welcome progress in the early part of project the number of patients subject to DTOC has climbed steeply since the end of December. This can only have had a detrimental effect on Four Hour Standard performance and is reflected in the performance reported this week.

In the second week in January there were 2,722 recorded instances of delayed transfers up from 2,531 the previous week. This translates to 6.36% of the acute bed stock.

Graph of cancelled elective operations since October

A total of 31,783 elective operations have been cancelled over the project to date. This represents overall average cancelled 38.48 operations per site over the period. However, the underlying range was zero to 302 in a single week.

Overall

As has previously been stated there is a well-established link between Four Hour Standard performance¹ and clinical outcomes for patients.² This week we are reporting that Four Hour Standard performance at Type 1 emergency departments has dropped below 75% for the first time. In simple terms this means that most contributors within the Winter Flow group are reporting performance at or below 75%.

¹ The NHS Constitution sets out that a minimum of 95 per cent of patients attending an A&E department in England must be seen, treated and then admitted or discharged in under four hours. This is commonly known as the four-hour standard. [NHS Constitution](#)

Published 13 January 2017

The other data reported this week shows quite clearly that Trusts/Boards are aware of this situation, and are doing their best to remedy it by providing more acute bed stock and freeing up capacity by cancelling elective operations.

Unfortunately, while this can be expected to support Four Hour Standard performance, contributors have been unable to halt further decline. It is now beyond dispute that patient safety is being put at risk. The mismatch between the demands being made of the service and the resources being made available to treat patients is clearly having significant consequences.
